

ANTITHROMBOTICS AND DENTISTRY – THE CLOT THICKENS

In recent years, the field of antithrombotic and anticoagulation medication (ATM) has seen significant change. There has been increasing use of non-traditional drugs in patients with cardiovascular and cerebrovascular disease. The dentist is now confronted with a patient with an increased propensity to bleed and a difficult conundrum: To keep the patient on ATM and risk prolonged bleeding, ecchymosis and swelling? On the other hand, stop ATM, with the risk of thrombus formation?

It is our sincere hope that this will frame the issue of ATM in clinical dentistry and shed some light on this issue. Although the recommendations exist, we strongly encourage all clinicians to 'tailor' their treatment plans (including ATM) according to their individual patient's needs and establish a close collaboration between dentist and attending physician.

TIME	PROGRAMME
