

MANAGEMENT OF ADHD

There is some controversy about the management of ADHD, from on one hand some who suggest that only medication is effective, to those on the other who say it is pretty ineffective, particularly in the long-term, and that psychological therapies should be core. However, there is some evidence that psychological therapies do not improve the basic symptoms of ADHD but rather the commonly associated conduct problems. This talk will review traditional approaches as above, plus briefly look at diet and brain stimulation, as well as how best to monitor treatment effectiveness.

Dr Stephen Scott
HMPD Visiting Expert

Professor of Child Health and Behaviour,
Institute of Psychiatry, Psychology and Neuroscience,
King's College London

07 Jan 2020, Tue
5:30pm - 7:30pm
