Summary statement

COVID-19 obligated us to make executive decisions about rescheduling non-urgent care in Radiology and those decisions balanced safety and functionality as we created a tiered clinical prioritization.
Rescheduling Non-Urgent Care in Radiology: Implementation during the COVID-19 Pandemic

INTRODUCTION

The COVID-19 pandemic continues to wreak havoc throughout the world, with an increasing number of countries and states under lockdown, shelter-in-place, or stay-at-home orders. Beginning in early to mid-March, there was a dramatic increase in the COVID-19 cases in western countries. For example, in the United States, there were a total of 98 confirmed COVID-19 cases on March 1st, 2020, followed by a “hockey stick” inflection with 1,158,341 cases at the time of writing(1). This led to rapid action at medical centers around the world to mobilize resources in response to the emerging pandemic(2).

As the COVID pandemic grew, the Centers for Disease Control and Prevention (CDC) advised that all healthcare facilities should prioritize urgent and emergency visits(3). The goal was to ensure staff and patient safety, prepare hospitals for a potential surge in COVID-19 cases, and preserve personal protective equipment (PPE). The CDC recommended delay of all non-emergent tests, visits, and elective procedures(3). The American College of Radiology (ACR) mirrored the CDC recommendation and urged imaging centers to “reschedule non-urgent outpatient imaging including screening mammography, lung cancer screening, non-urgent CT, MRI, ultrasound, plain film X-ray exams, and other non-emergent or elective radiologic and radiologically guided exams and procedures(4).”

Given the CDC, ACR, and hospital guidelines, we, at our institution started the rescheduling process on March 16, 2020. Our top priority was the safety of our patients and staff members. The purpose of this paper is to report our experience for rescheduling non-emergent imaging tests and procedures during the COVID-19 pandemic at our institution.

METHODS

We used the SQUIRE 2.0 guidelines to describe the framework of this practice implementation(5).
Setting:
Our institution is a large, urban, tertiary academic medical center. We have two hospitals and 5 free standing outpatient imaging centers. Our annual imaging volume is 430,000 studies with 300 technologists and 52 clinical faculty in the Department of Radiology.

Team:
Our Vice chair of Operations (FR) led the rescheduling team which included the department chairperson, imaging enterprise director, vice chairs, section chiefs, and executive business director. We had daily virtual huddles with discussion of rescheduling strategies, issue tracking, addressing problems real time, refining the process, and escalating communication. Each leader provided succession planning in the event of illness or other inability to participate.

Description of the Rescheduling Implementation:

Principles:
Decisions often had to be based on sparse data, specifically regarding the risk to the patients and staff of a busy department and the timing of our local surge. Because data were sparse, we opted for greater safety and made initial decisions to limit scanning to centers where we could manage traffic, and those with highest concentration of sick patients requiring imaging.

We opted to take full advantage of staff not clinically deployed to optimize the implementation of the rescheduling process, and reviewed all cases using radiologists, schedulers, residents, and administrative leadership. We created a tiered priority system to reschedule patients for whom imaging could be delayed with minimal clinical impact.

When possible, we maintained the organizational infrastructure of the department. However, we made
implementations as needed (residents creating spreadsheets, technologists triaging reading room calls and directing to section heads/ Vice Chair).

With the changing COVID-19 situation, we were obligated to either defer patients with no set reschedule time, or to select a re-entry point. Out of safety concerns, we decided to define an initial re-entry point for the rescheduled patients as May 4.

**Timelines:**

With a growing number of COVID-19 cases at a local level, there was an urgent need to immediately start the rescheduling process in mid-March. This was also a time of great uncertainty about the expected number of patients in our hospitals. Our state modelling projections predicted a large surge for Ohio. Therefore, we had to move expediently to increase scanner capacities to accommodate the potentially large numbers of infected patients. We also had to consider the anticipated delays related to scanner disinfecting processes between patients. A decision was made to implement the rescheduling initially for the first two weeks (March 16 – March 27). During this time, we also saw a high rate of self-cancellation by patients due to the community-based concerns and fears. As the number of COVID-19 patients steadily increased, the state of Ohio issued a ‘stay-at-home’ order on March 22. A decision was then made to extend the rescheduling of non-urgent imaging tests to May 4.

**Imaging Facilities:**

We reduced the number of imaging facilities open to only include the main hospitals, where we had the greatest number of scanners and best ability to sanitize. This led to the temporary closure of all of our free-standing imaging centers. The rationale was to reduce the number of technologists on site and to have staggered shifts with the purpose of decreasing staff exposure. Schedulers, technologists, and radiologists, including residents, assisted in calling patients with existing appointments to postpone the appointments, explain the rationale, and recommend deferred assessment in 6-8 weeks or as otherwise deemed appropriate.

**Workflow during implementation:**
To optimize knowledge and therefore safety, we mandated the clinical review of every patient scheduled until May 4. We created a high-level process map to assist central schedulers, technologists and radiologists (Figure 1). This involved using a radiology triage person who served as a single point of contact for patients and referring physicians. Many phone calls into the respective reading rooms were directed to our triage coordinator who distinguished urgent from non-urgent exams. New exam scheduling was ceased during this period. Only select administrators and technologists had access to the schedule and were made aware of urgent indications requiring immediate scheduling.

Radiologists were tasked with the responsibility for review of all scheduled outpatients, and this was primarily performed on a per section basis. We performed a complete EMR review to determine the need for either keeping the scheduled appointment, or rescheduling. The review included the indication for the study, medical problem list, verified reports for any pertinent previous imaging, the most recent note placed by the referring provider, and any subsequent communications found in the system regarding symptoms and management. The severity and complexity of findings on prior scans was carefully considered. The likelihood that intervention (surgery, radiation etc.) would need to be performed within the next few months was also assessed.

A tiered framework/category of urgency(6) was utilized to prioritize studies for patients who required imaging to make critical clinical management decisions and reduce morbidity and/or mortality. While wait lists are uncommon in the US and unfamiliar to radiologists in our region, there is precedent for patient prioritization tools(7), especially when wait times are long. Below are few examples of our priority tiers.

**Tier 1**: Patient requisitions for emergent studies did not need approval from radiologist:

1. CT Pulmonary Angiography
2. New focal neurological deficit
3. Mental status changes

Several requests for “pain”, or “severe pain” were considered, but the department made the decision to not allow these cases to be placed in Tier 1. Clinical consultation was required and enforced by the
Vice Chair. Studies that came from the Emergency Department were generally placed in Tier 1.

**Tier 2**: Patients whose appointments were not rescheduled:
1. Neoplasm with potential progression findings concerning for active disease on most recent imaging, or for which treatment options hinged on imaging results.
2. Recent surgery (3-6 months) with signs or symptoms related to complication or recurrence of the initial problem.

**Tier 3**: Patients whose appointments were rescheduled:
1. Breast and lung cancer screening. RADS 3 and 4 category lung cancer screening studies were handled on a case-by-case basis to determine scan urgency.
2. Chronic pain
3. Known malignancy with prior stable imaging.
4. Cases for whom the indication was not clear and review of the EMR showed ambiguous appropriateness. For most of these cases, the referring clinician was contacted and in some cases placement in Tier 2 was justified.

**EMR documentation:**
Patients were rescheduled and demarcated within the scheduling interface of EMR. Additionally, documentation was entered in each patient’s chart, including readily retrievable communication(s) to the patient, referring provider, and/or a standard chart note (Figure 2). Two key concerns dominated our discussions: adequate EMR documentation and the ability to prospectively track all rescheduled patients. We redeployed our residents (on ‘work-from-home’ shifts) to facilitate the EMR communications and to chart patients on a subspecialty and modality basis.

**Communication:**
We disseminated information about the rescheduling implementation plan widely and frequently throughout the department and obtained feedback. Section chiefs communicated the discussions from
the daily huddles to their section members via email/group texts/virtual meetings. The vice chairs of
education (EE) and research (AV) informed the residents and research staff respectively. The imaging
director (BA) held daily meetings with the technologists across the enterprise. In addition, the chair
(MM) sent out a department wide daily email highlighting the minutes of the leadership huddle. We also
communicated with referring clinicians’ and surgeons’ offices including system wide emails and
personal phone calls to alleviate the number of incoming requests.

Special considerations:

Interventional Radiology procedures: Given the unique needs of intervention radiology (IR), the IR
section chief (AM) created a separate process for outpatient vascular and interventional procedures. In
addition, all clinic visits were provided by Telehealth. The IR process included a tiered framework with
three comprehensive lists of procedures and a process map (Figure 3).

- List (A) was Urgent/Emergent Procedures that needed to be scheduled. Representative
  examples included port for chemotherapy due to start in the following week, exchange of
  drainage catheters for malfunction, leaking, falling out, malposition, catheter break.
- List (B) were cases that need to be rescheduled but can be scheduled if determined urgent by
  referring physician and/or IR radiologist. Examples included renal, liver, bone marrow biopsy
  (unless referring physician declared it as urgent), chemoembolization or radioembolization
  (unless interventional radiologist declared it as urgent).
- List (C) were cases that should be rescheduled/postponed. Examples included thyroid biopsies,
  dialysis access planning venograms, and varicoceles embolization.

Breast imaging: Diagnostic assessment and core biopsy of cases with high suspicion for malignancy or
known cancer were not postponed in order to avoid progression of disease that could negatively impact
patient outcomes. We utilized multidisciplinary coordination to determine priority for elective surgery
and neoadjuvant or adjuvant treatment for breast cancer patients(8)

Nuclear medicine: Rescheduling of certain radionuclide therapies was challenging. Therapies such as I-
131 radioiodine for thyroid cancer require significant patient preparation (i.e. multiple days of a low-
iodine diet and receiving intramuscular injections of thyrotropin alfa on two separate days). We opted to
complete I-131 therapies that were already scheduled. In addition, patients receiving parenteral radionuclide therapies were continued as scheduled, but new patient consents and therapies were deferred.

Research studies: As per the university guidelines, all non-essential research ceased. Only essential or critical (COVID-related) research which required approval of the College of Medicine research committee and the Institutional Review Board, was allowed. We implemented a tracking system in conjunction with the clinical trials office to identify essential/critical research scans to ensure that these were not rescheduled.

RESULTS

Approximately a total of 30,000 studies were rescheduled. We compared the volumes of imaging studies using a snapshot of a month-long period beginning from the start of our rescheduling process. There was a significant decrease in overall imaging volume (53.4%) as compared to same period (March 16-April 15) in past year. The total number of imaging studies was 38,369 in 2019 as compared to 17,891 in 2020 during this time period. The total weighted relative value units (wRVU) in this time period was 21,737 in 2019 as compared to 10,354 in 2020 (a decrease of 52.4%). (Figure 4)

Although we saw the largest reduction in outpatient volumes (72.3%), there was also a significant decrease in imaging in the inpatient (40.5%) and emergency department (ED) (48.9%) settings. Total outpatient imaging volumes during March 16-April 15 was 20,717 in 2019 as compared to 5,739 in 2020, inpatient imaging was 15,592 in 2019 as compared to 9,279 in 2020 and ED imaging was 7,262 in 2019 as compared to 3,709 in 2020.

DISCUSSION

Our department began a rescheduling implementation for all nonurgent studies in the second week of March through May 4, 2020. During this process, we relied on the guiding principles detailed above and quickly realized the importance of frequent communication. The use of multiple channels to disseminate
information (virtual daily huddles, emails, group texts, phone calls, EMR messaging, virtual faculty meetings, hospital webpage) was critical in relaying the information to all of our stakeholders; patients, referring physicians, and the radiology workforce. The process maps and EMR templates we developed were critical in allowing internal staff to deliver consistent messages.

Managing operations with flexibility is important(9). We followed a “scrum methodology”(10) creating quick sprints and making quick adjustments in the process map. All team members had a specific role, but all of us were working towards quick adoption and adaptation of changing strategies. Developing a generalized plan for common tiered systems for all sections and all hospital/outpatient imaging centers was not feasible, and hence the tasks were subdivided to individual leaders. This worked well as the individual leaders had an in-depth understanding of their systems plus interpersonal relations with referring physicians for optimal execution.

Like many other health systems, we are witnessing the tremendous impact of this pandemic. The imaging volumes have drastically reduced, and this parallels the impact seen across other radiology departments in the country and the world(11, 12) Interestingly, in addition to the decreases in non-urgent imaging, we also saw a decrease in ED imaging volumes, suggesting that patients are less willing to come to hospitals during the COVID outbreak. This trend was also seen in multiple other emergency departments around the country(13). The health impact of delaying imaging for a large proportion of patients is unknown and difficult to estimate. Although the social distancing and “stay-at-home” orders are reducing COVID-related mortality and morbidity, they may also result in an increase in non-COVID deaths and delays in care(14).

As the number of COVID cases in our region are hopefully nearing a plateau, we are now actively working on a recovery/reentry plan. This will involve a phased process to ensure adequate social distancing. We will be implementing the valuable lessons that we learned during the rescheduling process, including clear communications. For example, we are posting social media messages about our steps to maintain patient safety. Our residents are also contacting and reassuring patients regarding the safety of our imaging facilities. We understand that how we operationalize our recovery, including patient experience during reentry, is critical for our stabilization.
Limitations and issues that we faced:

Given the acuity and fluidity of the COVID-19 situation, our rescheduling process did not follow the usual stringent guidelines of a practice implementation plan. We did not have a perfectly streamlined process from the outset. The virtual daily huddles were important and helpful to refine our process real-time, as issues and loopholes were quickly identified and addressed, resulting in an improved and integrated plan by week 3 of rescheduling. This included robust EPIC documentation (including backfilling from week 1 and 2) and assimilating a master list of all rescheduled patients.

The pandemic highlighted some aspects of our academic medical center that are not nimble. For example, our technologists and radiologists belong to different health systems with different email domains which limited file sharing capabilities and added extra steps to our communications. A common limitation reported by radiologists was the difficulty in obtaining accurate clinical indications from the EMR efficiently, resulting in a time intensive process. The indication for the study was not readily seen on some of the schedule filters. The order entry in our system utilizes clinical decision support for all cross-sectional imaging; however, no hard stops exist if meaningless, misleading, or inaccurate information is entered. For example, a clinician can enter “*” or “other” as the study indication, which in turn required a deeper chart review. For some patients, the severity of symptoms and activity of disease were not clear even after extensive review of the EMR. These patients were contacted to ask about new or progressive symptoms since the last scan, to provide a more accurate assessment of the urgency for scanning.

We also received some initial push back from some of our referring physicians who did not agree with our tiered framework and insisted on starting their own independent algorithms. This required discussions at physician leadership levels, and we were able to address their concerns on a case-by-case basis.

We could not reach some patients in spite of multiple attempts and a few presented for their scheduled appointment. There was an initial lack of consensus as to whether to perform these scans versus send the patients home after explaining the rationale for rescheduling. It was finally agreed that it was best to reschedule the walk-in patients, for overall safety of patients and radiology staff members.

4. **Molly will call centralized scheduling or ordering physician with appropriate instructions**
5. **Centralized scheduling calls patient with decision/ if ordering provider requests, they will be given Radiologist that approved/denied**

*Studies approved without consultation with radiologists: CT pulmonary angiography, acute stroke imaging, non contrast head CT for new neurological deficit and mental status change*

*Oncology staging/restaging, new diagnosis of cancer, DXA for transplant are also approved*

Molly will work Monday-Friday 0800-1630. **If away from phone, another person will be assigned**

If necessary, Molly will call and discuss with Dr. Rybicki (frank.Rybicki@uc.edu) or cell number xxx-xxxx-xxxx*
Dear Provider,

Due to pandemic of COVID-19, the UC Health & Department of Radiology are following the guidelines of the Centers for Disease Control and Prevention (CDC) and the American College of Radiology (ACR). These guidelines advise medical facilities to reschedule elective/non-urgent outpatient visits, imaging exams and procedures.

As a result, @NAME@’s upcoming elective imaging study was rescheduled. This chart note is intended to notify you of this change and to note that the Department of Radiology is taking every possible precaution within the guidelines.

If an imaging exam/procedure is needed in a time sensitive manner, we recommend that you create a new EPIC order for the study and include a note in the order that the patient needs imaging earlier than rescheduled date despite COVID-19 precautions. Your new order will be reviewed by a radiologist who may ask you for additional clinical information and feedback. Lastly, for each rescheduled patient, UC Health Scheduling and/or our technologists made one or more attempts to reach the patient. This communication to patient has been documented in medical record.

Thank you for referring your patient for imaging in our department. We are proud to provide the most comprehensive imaging services and strive for excellence in patient care and safety.

UC Department of Radiology
Scheduler reviews the previously scheduled procedure or the protocolled procedure by the APP. Which List is the Procedure Under?

**LIST A**
Schedule the Procedure

- **Referring Physician Agrees**
  - Scheduler reschedules the procedure and places a note

**LIST B**
Scheduler contacts the referring Physician to reschedule

- **Referring Physician Declares it urgent**
  - Scheduler schedules the procedure and places a note

**LIST C**
Scheduler contacts the Patient 1st to reschedule

- **Patient Agrees**
  - Scheduler reschedules the procedure then notifies the referring physician and places a note
- **Patient refuses to postpone procedure OR provides additional urgent clinical information**
  -Pt provides urgent clinical information such as tube leaking
  - Scheduler schedules the procedure (can consult IR physician or APP if unsure)

- **Patient refuses**
  - Scheduler to consult with IR physician or APP
**Take - Home Points:**

The rescheduling process during the COVID-19 pandemic was different than our usual departmental processes where there is an abundance of information, data, and conversations before implementing a practice plan. During the COVID-19 phase, we had to make quick decisions but the actual risks were unknown and data was extremely limited.

We used a tiered priority system to reschedule patients for whom imaging could be delayed with minimal clinical impact. Safety and the need for information mandated a detailed EMR review of each patient.

We faced multiple challenges that taught us indispensable lessons. There was lack of institutional nimbleness due to different health system information networks, resulting in additional steps. We learned that information systems need to be proactively consolidated and linked within an institution to facilitate communication. The EMR searches were time intensive highlighting that accurate, and easily accessible clinical information is a requirement for efficient and medically sound triage decisions.

Recognition of not ‘one-system-fits-all’ within a Radiology department was vital for us. We designated a manageable team that represented all sections of the enterprise including key department leaders to coordinate efforts and obtained daily feedback.

Our rescheduling process was not perfectly streamlined and we had to be flexible in our operational strategy, particularly given the changing COVID-19 situation. Agile iterations of the process helped us to rapidly respond to changing timelines and resources.

Clear, effective, and frequent communication through multiple channels was critical as we relayed our policies and procedure information to all our stakeholders including patients, referring physicians, and the radiology workforce.
